Before Training:
The generated images appear as uniform grey squares with no recognizable objects or meaningful visual features. This indicates that the model had not yet learned the patterns and characteristics of the training dataset.

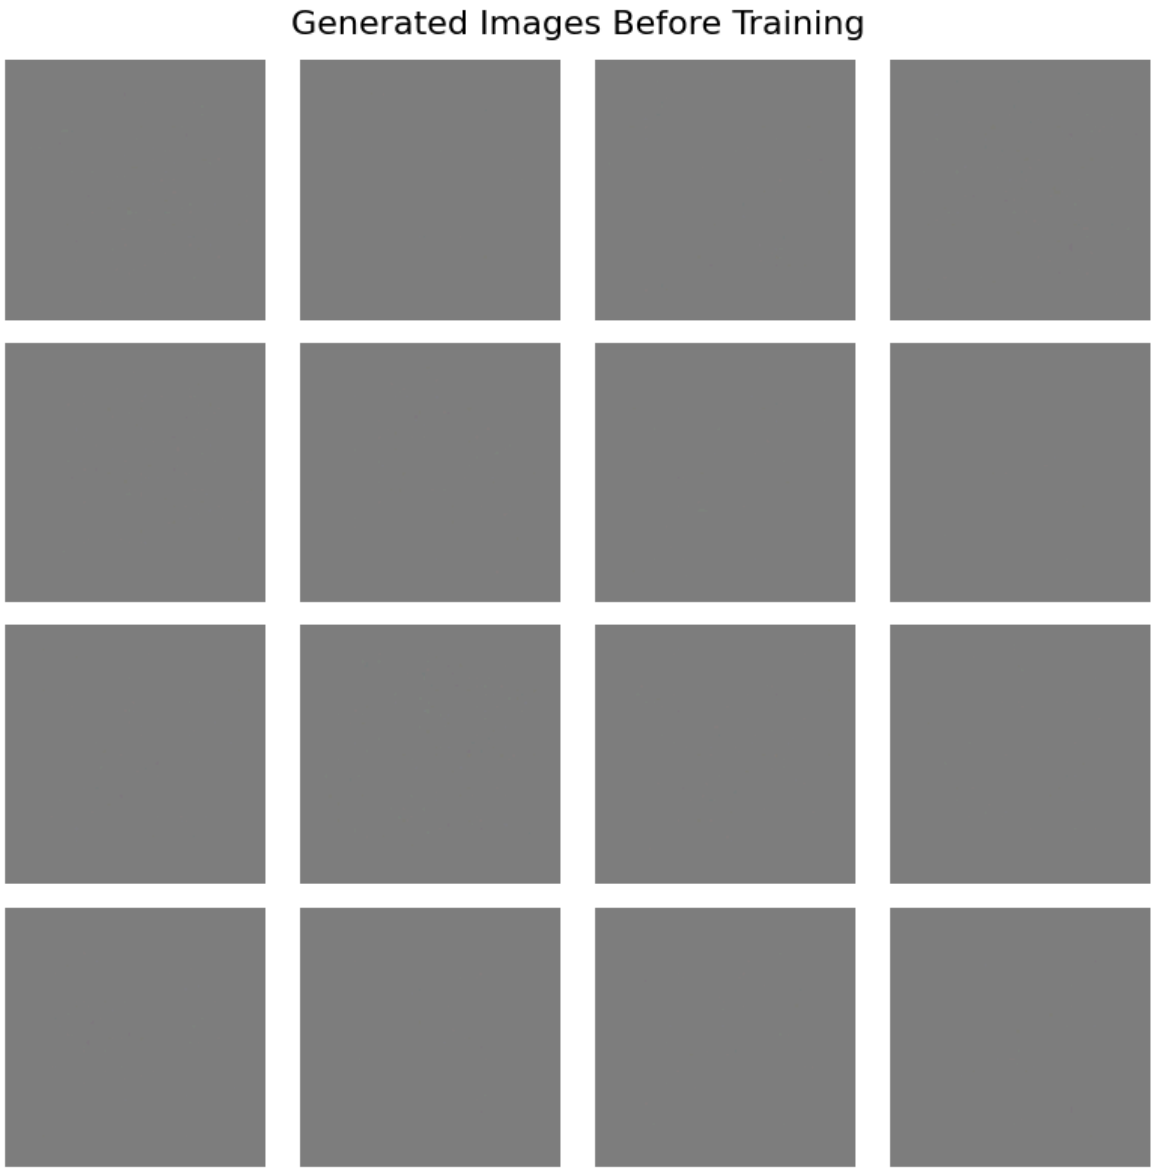

Figure 1 - Generated Images before training

After Training:
The generated images show recognizable apples with red and yellow colors, approximately round shapes, and visible details such as stems and surface imperfections. This demonstrates that the model has successfully learned some visual patterns from the training data.

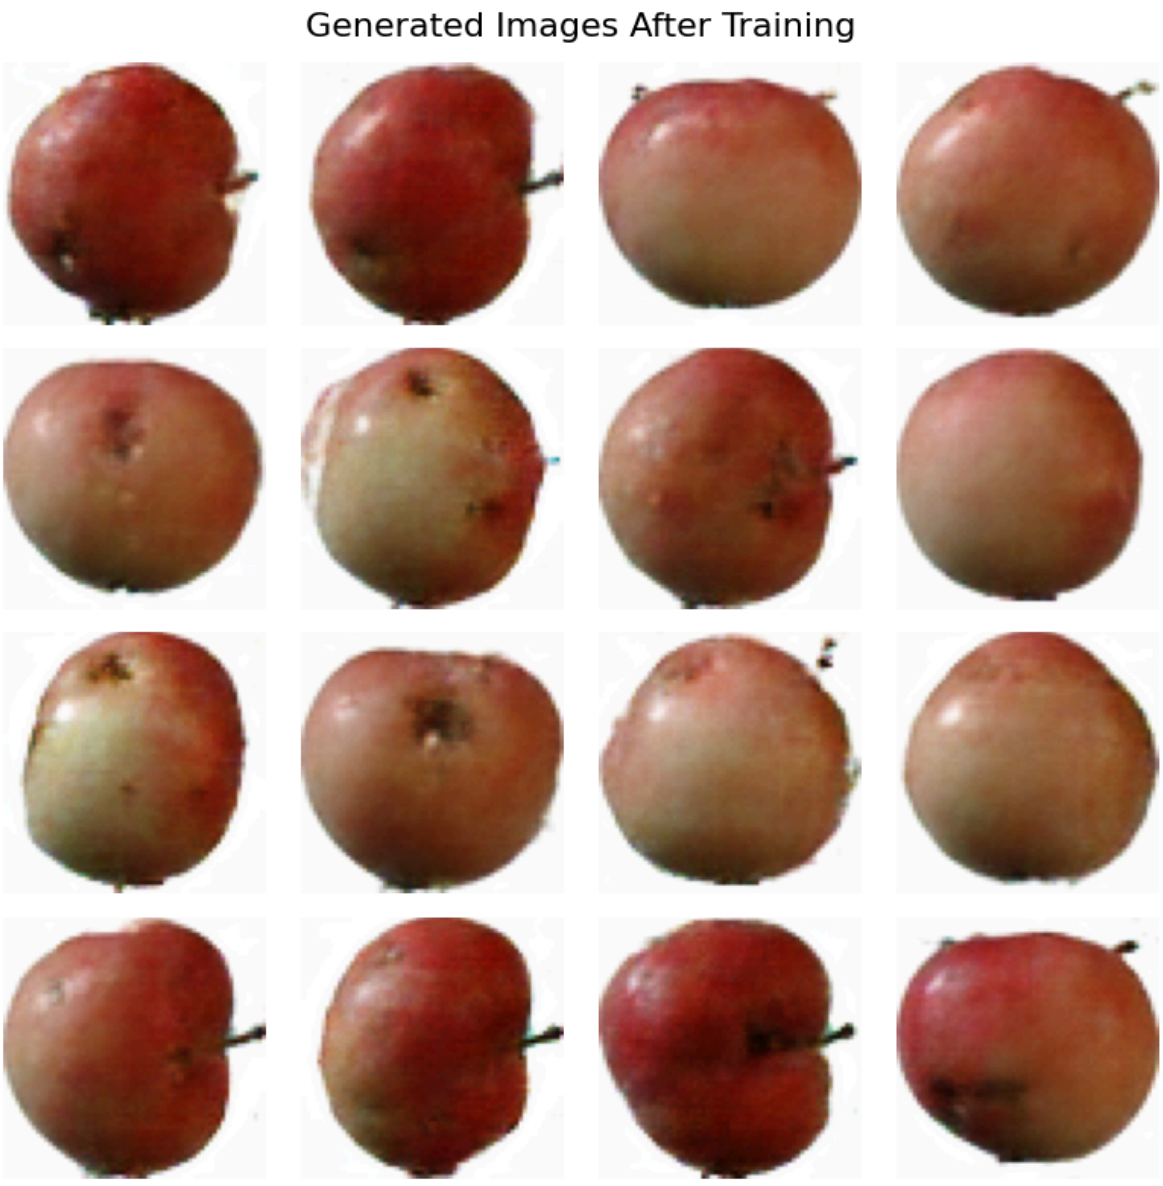

Figure 2 - Generated Images after training

Overall:
The image quality improved significantly after training. However, some issues remain, including blurry textures, inconsistent shapes, and occasional visual distortions. The generated images also lack fine details and sharpness. Further training and hyperparameter tuning could help improve image quality and consistency.
